

Tour Jamaica Mobile App

Client Environment - Frontend and Backend Implementation Guide

This guide explains how the Client Environment should be implemented inside the single Tour Jamaica mobile app. The app must remain mobile-first, role-based, simple, functional, and visually aligned with the approved green, cream, champagne, and luxury interface direction.

1. Direction

App model	One Tour Jamaica mobile app with role-based environments.
Included roles	Client and Experience Host only for this mobile app phase.
Login behavior	Role is determined by authenticated user credentials, not by manual role selection.
Client purpose	Give guests a private place to view itinerary, request add-ons, message the CEA, receive updates, and access trip details.

2. Frontend Build Requirements

Mobile app structure

- Build as a mobile-first app shell that can render either Client Environment or Experience Host Environment after login.
- Use the approved visual language: deep green landing screens, beige/cream app surfaces, rounded cards, restrained gold accents, light green action states, clean bottom navigation.
- Add the company logo at the top of the green landing/login experience using a placeholder path such as company-logo.png.
- Use the wording Ground Transport everywhere; remove Private Ground Transport wherever it appears.

Login flow

- First screen: green brand landing screen with logo, Tour Jamaica, Ground Transport, location list: Montego Bay, Negril, Ocho Rios, Kingston, and a light-green Log In button with no arrow.
- After Log In, show the beige login panel only. Do not show the green landing and beige login panel at the same time.
- Login fields: First Name, Last Name, Passcode. Actions: Enter, Scan Code, Forget Passcode. Keep SHOW/HIDE passcode behavior.
- Remove role selection boxes. Determine environment from authenticated user profile returned by the backend.
- After successful login, show a 5-second green welcome screen with first-letter monogram before opening the correct environment.

Client welcome text

Welcome, Morgan

Your Tour Jamaica experience is now ready.

Available inside your private app.

Client navigation tabs

Use five bottom tabs: Home, Itinerary, Add-Ons, Messages, Updates. Keep Profile/Trip Details inside Home or the top avatar area. The Add-Ons icon should be a literal plus symbol. Remove diamond-style icons and replace them with functional icons

such as shield, message, bell, route, home, or check.

3. Client Environment Screens

Home

- Show client summary: first name, experience level, travel dates, accommodation, vehicle, CEA, Experience Host, and journey status.
- Use a unisex default avatar with a Change Avatar option. Do not use client photo upload as a primary content section.

Itinerary

- Keep two views: Full Trip View and Day-by-Day View.
- Display only guest-facing itinerary data: trip overview, arrival, excursion days, departure, pickup/drop-off times, accommodation, vehicle, attractions, meal notes, and guest experience notes.
- Hide all internal notes: FTS notes, Experience Host notes, CEA internal notes, payroll, dispatch, backend sync, readiness logs.
- Use Priority Arrival Access as the correct term. Lounge Access must remain separate.

Add-Ons

- Show add-on cards with ultra-realistic image panels on the left and the existing number overlay preserved.
- Sample add-ons: Private Yacht, Helicopter Tour, Private Dinner, Cake/Celebration, Lime Cay, Solitude Hike, Priority Dinner Transfer, Jet Skiing, Snorkeling, Private Dining.
- Add a Custom Request section with Request Title, Request Details, and Submit Custom Request.
- Flow must be request-first: Request Add-On -> Processing -> CEA Approval -> Payment Available -> Paid -> Confirmed. Do not show Pay Now before CEA approval.

Messages

- Provide simple guest-to-CEA messaging, not a full public chat.
- Allow quick message types plus a custom message box. Send to assigned CEA email and save in backend.
- Include a placeholder for the CEA profile/photo later to make the page more personal.

Updates

- Display updates like a simple inbox: From, Message, Time. No ads or promotional content.
- Add a notification bell with unread count. Selecting a notification should open/filter the Updates tab and mark it as read.
- Updates may come from CEA, Experience Host, or system automation.

4. Backend Build Requirements

Core backend responsibilities

- Authenticate users and return role, profile, booking, and assigned trip data.
- Serve client itinerary data from finalized CEP itinerary records.
- Support add-on request workflow and CEA approval before payment.
- Support CEA and Experience Host updates to the client app.
- Support guest messages to CEA email and internal message archive.
- Track notification read/unread status.
- Support avatar upload and media storage.

Suggested API endpoints

Endpoint	Purpose
----------	---------

POST /api/auth/login	Authenticate and return user role plus environment access.
GET /api/client/profile	Return client profile, booking, CEA, Experience Host, and trip summary.
GET /api/client/itinerary	Return finalized client-facing itinerary only.
GET /api/client/add-ons	Return add-on catalog and request statuses.
POST /api/client/add-ons/request	Submit add-on request to CEP/CEA approval queue.
POST /api/client/add-ons/custom-request	Submit custom add-on request to CEP/CEA approval queue.
POST /api/client/add-ons/{id}/payment-intent	Create payment only after CEA approval.
POST /api/client/messages	Send guest message to CEA and save record.
GET /api/client/updates	Return inbox-style updates.
PATCH /api/client/notifications/{id}/read	Mark notification/update as read.

5. Survey, End Trip, and Archive Logic

Departure day End Trip trigger

Because FTS is the primary Start Shift and End Shift authority, add a separate End Trip button to the Departure Day of the Experience Host environment. This is not payroll shift closure. It is a trip-completion action.

- When Experience Host taps End Trip, mark the itinerary/trip as completed.
- Remove the completed itinerary from the Experience Host Itinerary tab.
- Archive the completed itinerary in FTS -> Archives -> Completed Trips.
- Schedule the Client Experience Feedback Survey email to send 3 hours after End Trip.

Survey email

- Send from info@booktourjamaica.com.
- Subject: Thank You For Travelling With Us.
- Send the survey email in a luxe format, with the survey content/message as provided and no extra body text.
- Send 3 hours after End Trip on Departure Day.

After Submit Experience Feedback

- Save response to CEP under the completed booking/client record.
- Send survey response notification/copy to ceo@booktourjamaica.com, gm@booktourjamaica.com, and the assigned CEA email.
- If review consent permits publication, place the review in an admin approval queue before showing it on the website.
- Photo uploads must go to secure storage and require approval before public or marketing use.

6. Communication Routing Recommendation

Use the Client Updates tab as the single guest-facing communication point. Avoid WhatsApp as the primary Driver-to-Guest channel. CEA and Experience Host messages should be saved as backend records and delivered to the client as in-app updates/notifications.

- Guest -> CEA: Client sends message in Messages tab. Backend emails the assigned CEA and stores the message.
- CEA -> Guest: CEA sends update from CEP. Backend creates client update and notification.

- Experience Host -> Guest: Experience Host sends controlled update from their environment. Backend creates client update and notification.
- Client app bell shows unread count. Selecting a bell item opens the Updates tab and highlights the related update.

7. Suggested Data Tables

Table	Use
users / roles	Login, role selection by backend, profile ownership.
clients / bookings / trips	Client, trip, itinerary, assigned CEA and Experience Host.
itineraries / itinerary_days / attractions	Full and day-by-day itinerary data from CEP.
add_ons / add_on_requests	Catalog, custom requests, processing, approval, payment state.
payments	Payment provider references, amount, currency, status.
client_messages	Guest messages to CEA, status, email delivery reference.
client_updates / notifications	Inbox updates, sender, message, read/unread, source.
completed_trips	FTS archive record after End Trip.
survey_responses	Feedback survey answers, consent, photos, notifications.
media_uploads	Avatar, survey photos, add-on imagery references.

8. Final Implementation Notes

- Keep the client app clean and operational, not promotional.
- Use the uploaded add-on images as visual references/assets for add-on cards.
- All payment actions must wait for CEA approval.
- All guest-facing itinerary content must be filtered from internal operational notes.
- All communication to the guest should appear as structured Updates and bell notifications.
- End Trip is the Experience Host trip-completion trigger; FTS remains the shift authority.
